

## FORWARD VERTICAL JUMP

**Do 3 sets of 10 jumps per leg.**

Jump forwards vertically, then land on a ledge or curb (with the same leg.) Focus on a point in front of you to stay balanced. Controlling your landing is the key to this exercise.

## FLAT LATERAL JUMP

**Do 3 sets of 7 jumps per leg.**

In this exercise, controlling the landing is key to protecting your ankles. Define a responsible jump distance, and stick to it; this will help you land with control. Focus on a fixed point in front of you to help control your balance.

## UPWARD STRIDE

**Do 3 sets of 10 jumps per leg.**

Place one foot on a box in front of you. Then, jump upwards, bringing the opposite knee up so that you form a right angle between your leg and pelvis. You should land with control, and without much force. Repeat without stopping.

## CONTINUOUS JUMP

**Do 3 sets of 10 jumps.**

Jump forwards onto a box or crate. Use the momentum from your jump onto the box to jump forward a second time, landing in front of the box. Continuity and control are the keys to this exercise.

## CONTINUOUS VERTICAL JUMP

**Do 3 sets of 20 total jumps.**

This is the continuous version of the forward vertical jump. Repeat the exercise by switching legs without stopping. Focus on controlling each landing; this is the key to executing a continuous vertical jump.

## LATERAL STRIDE

**Do 3 sets of 5 jumps per leg.**

Find a step (max. 1 foot tall.) Jump laterally and land on the step with force. When you land, your leg should be straight. Your opposite knee should raise to a strong 90 degree angle. The goal of this exercise is to land with power.

## TWO-LEGGED JUMPS

**Do 3 sets of 5 jumps.**

Jump onto a box with both legs. The most important is to land with control; don't over-exert yourself trying to jump too high. Using an object with a height of 18-24" (45-60 cm) is ideal.
